Live Weather Dashboard – System Design

Tech Stack Selection

- Frontend: React.js, TailwindCSS/Bootstrap,
Axios/Fetch API, Recharts - Backend (Optional):
Node.js + Express (for proxy & caching) - API
Provider: OpenWeatherMap API /
WeatherAPI.com - Deployment: Vercel / Netlify
(Frontend), Render / Heroku (Backend)

UI Structure

```
----- | Weather Dashboard
| ----- | Search Bar (Enter
city name) | [Search Button] | -----
----- | Current Weather Card: || - City Name, Country || -
Temperature (°C/°F) || - Weather Condition + Icon || -
Humidity, Wind Speed, Pressure | -----
----- | Forecast Section (Next 5 Days) || - Cards with
Date, Temp, Condition | -----
--- | Charts / Graphs || - Temperature Trend (line chart) || -
Humidity & Wind Speed (bar chart) | -----
-----
```

API Schema Design

Endpoint: GET

https://api.openweathermap.org/data/2.5/weather?q={city}&appid={API_KEY} GET

https://api.openweathermap.org/data/2.5/forecast?q={city}&appid={API_KEY} GET

Example Response (simplified): {
"city": {"name": "Chennai", "country": "IN"}, "list": [{ "dt_txt":
"2025-09-15 12:00:00", "main": {"temp": 303.15, "humidity":
78, "pressure": 1005}, "weather": [{"description": "light
rain", "icon": "10d"}], "wind": {"speed": 4.5} }] }

Data Handling Approach

1. Frontend calls API with cityname input
2. API response parsed → Extract fields: City, Temp, Condition, Humidity, Wind, Pressure
3. State management with React useState/useEffect
4. Data mapped to UI Components (cards, charts)
5. Error handling with fallback UI
6. Optional caching in localStorage

Component / Module Diagram

[App] | |-- [SearchBar
Component] |--
